

RED TEAM PROJECT SCOP

April 27, 2026

INTRODUCTION TO RED TEAMING

1. What is red teaming?

Red teaming is the process of emulating the tactics, techniques, and procedures (TTPs) of real-world threats or APTs, with the goal of measuring the effectiveness and resilience of defenders (Blue Team), employees, processes, and the underlying technology of a target organization.

The primary goal of red teaming is to gain a comprehensive understanding of an organization's ability to detect and defend against adversarial tactics, techniques, and procedures (TTPs).

Red teaming originated in the military, where designated units simulate adversarial behavior and attack techniques to evaluate the effectiveness and readiness of defensive teams.

This process provides organizations with valuable insights into their Blue Team's capabilities, identifying gaps where detection and defense mechanisms can be strengthened.

2. Security Assessments

To understand why red teaming is important, you first need to know the different types of security assessments used by organizations, their objectives, and how they differ from each other.

From an offensive perspective, organizations use different security assessments to get a clear understanding of their threat surface, risks, possible business impact, and how strong their defenses are.

3. Vulnerability Assessments

vulnerability assessments are a common preventive security method where systems and assets are scanned to find vulnerabilities and misconfigurations. This helps organizations understand their threat surface and security level better.

This helps the company decide where to focus their patching and remediation.

This helps the company decide where to focus its patching and remediation efforts.

4. Penetration Testing

Penetration testing involves finding and trying to exploit vulnerabilities in a target system. It goes beyond vulnerability assessment by showing the real impact through exploitation.

Penetration testing doesn't stop at initial access; it also includes different post-exploitation activities.
